## Abstract of DE 10055465 (A1)

Bone replacement material (I) comprises nonmetallic inorganic filler particles (3) embedded in a laser-sinterable biocompatible polymer matrix (2). Independent claims are also included for the following: (1) (1) a process for producing a bone replacement implant, comprising: (a) preparing (I) as a powder mixture; (b) depositing a layer of the powder; (c) laser-sintering the layer according to predetermined implant geometry data; and (d) repeating step (b) and (c); and (2) (2) a bone implant comprising (I) in which the filler particles on the surface are only partially embedded in the matrix.
